

# Murray and Sunraysia – Algae Alert Status

15 October 2026

This Blue-green algal (BGA) alert report is based on routine monitoring at sites in the Murray & Sunraysia Algae Reporting Area. The sites are monitored by WaterNSW and local water authorities. Satellite imagery may be used to supplement the monitoring data.

**Please see Table 1 for all red, amber and green alerts.**

## Red Alerts

- Lake Menindee at Sunset Strip

## Amber Alerts

- |                                    |                                  |
|------------------------------------|----------------------------------|
| • Gulpa Creek at Mathoura          | • Darling River upstream Weir 32 |
| • Darling River at Wilcannia       | • Darling River at Tolarno       |
| • Lake Wetherell Sites 3 & 4       | • Darling River at Poongcarie    |
| • Lake Copi Hollow                 | • Darling River at Tapio         |
| • Lake Menindee Outlet Regulator   | • Darling River at Ellerslie     |
| • Darling River Menindee BHWB Pump | • Darling River at Burtundy      |

## Climate Outlooks

For November to January, there is no clear signal for rainfall across most of the regions, meaning there is a roughly equal chance of above or below average rainfall. Both maximum and minimum temperatures are very likely (greater than 80% chance) to exceed the average. (Source: [Bureau of Meteorology \(BoM\)](#))

## Algal Outlook

The risk of blue-green algal growth remains low across the eastern Murray River region, with increasing risk in the western regions. Where flow conditions are low and waters are shallow the risk is higher. With a warmer than average spring forecasted, conditions will continue to become more favourable for algal growth.

**Satellite image observations start on page 4 of this report.**

Table 1: Combined Murray and Sunraysia Alerts.

| Site                       | Description                         | Latest Sample Date | Cyanobacteria Total Count (cells/mL) | Cyanobacteria Biovolume (mm <sup>3</sup> /L) | Potentially Toxic Cyanobacterial Count (cells/mL) | Potentially Toxic Cyanobacterial Biovolume (mm <sup>3</sup> /L) | Current Status (based on Latest Sample) | Previous Status | Cyanobacteria dominant potentially toxic taxa    | Cyanobacteria Comments           |

## Satellite imagery

The key to the approximate total algae (blue green and non-blue green) concentrations using the Custom Algae Script can be found in Table 3. The actual values can potentially vary by a significant margin due to the geology of the waterbody, species of algae, turbidity, aquatic plants, time of day of the image capture, aerosols in the atmosphere, etc. This variability is a result of the nature of satellite imagery being a large-scale remote sensing format and is not function of the technology or the script itself. For this reason, these colours and descriptors are not the official “**Algae Alert Level**” but rather provides information on the **potential risk on algae formation**.

Table 3: Observed risk levels based on the estimated photosynthetic activity for Custom Algae Script

| Map Colour | Risk Level - | Starting concentration guide range | RACC recreational alert values approx. equivalence |
|------------|--------------|------------------------------------|----------------------------------------------------|
| Blue       | Very low     | <0.05 mm <sup>3</sup> /L           | No Alert                                           |
| Green      | Low          | 0.05 to 0.5 mm <sup>3</sup> /L     | Green                                              |
| Yellow     | Medium       | 0.5 to 5.0 mm <sup>3</sup> /L      | Amber                                              |
| Red        | High         | 5.0 to 20.0 mm <sup>3</sup> /L     | Red                                                |
| Dark red   | Extreme      | > 20 mm <sup>3</sup> /L            | Red                                                |

## Observations about the satellite images

**Hume Dam** (Figure 1) - The last satellite image from the 8<sup>th</sup> of October indicated mostly very low phytoplankton activity across the lake.

**No new images of Menindee Lake System** (Figure 2) - The image from the 6<sup>th</sup> of October indicated an increase to mostly moderate levels of algal activity in the northern banks of Lake Cawndilla and Cawndilla Creek. Low levels of algal activity were indicated across Lake Menindee and Lake Wetherell site 2. Mostly very low levels were indicated at Lakes Tandure, Pamamaroo, the centre of Lake Cawndilla, Copi Hollow, Weir 32 and Wetherell site 1, 3 & 4. Increased algal activity is indicated in the stretch of river between Lake Wetherell sites 3 and 2.

**No new images of Murray River at Wentworth** (Figure 3) - The satellite image from the 6<sup>th</sup> of October indicated low levels of phytoplankton activity in the Murray River and mostly very low levels in the Darling River.

**No new images of Lake Victoria** (Figure 4) - On the 7<sup>th</sup> of October, mostly very low phytoplankton activity was observed across the lake.

## Alert Definitions for Recreational Waters

Alert Definitions as specified in The National Health and Medical Research Council (NHMRC) *Guidelines for Managing Risks in Recreational Water* 2008.

The interim use of these guidelines is endorsed by the Scientific Subcommittee of the NSW Algal Advisory Group.

### RED ALERT

These alert levels represent 'bloom' conditions. Water will appear green or discoloured and clumps or scums could be visible. It can also give off a strong musty or organic odour.

Algae may be toxic to humans and animals. Contact with or use of water from red alert areas should be avoided due to the risk of eye and skin irritation. Drinking untreated or boiled water from these supplies can cause stomach upsets. Alternative water supplies should be sought or activated carbon treatment employed to remove toxins. People should not fish when an algal scum is present. Owners should keep dogs away from high alert areas and provide alternative watering points for stock.

### AMBER ALERT

Blue-green algae may be multiplying, and the water may have a green tinge and musty or organic taste and odour. The water should be considered as unsuitable for potable use and alternative supplies or prior treatment of raw water for domestic purposes should be considered. The water may also be unsuitable for stock watering. Generally suitable for water sports, however people are advised to exercise caution in these areas, as blue-green algal concentrations can rise to red alert levels quickly under warm, calm weather conditions.

### GREEN ALERT

Blue-green algae occur naturally at low numbers. At these concentrations, algae would not normally be visible, however some species may affect taste and odour of water even at low numbers and does not pose any problems for recreational, stock or household use.

## Key to Alerts for Recreational Waters

|                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### **Livestock Drinking Water Guidelines Based on ARMCANZ (2000), Orr and Schneider (2006) and WQRA (2010)**

This guideline should be used when water is used for livestock drinking water purposes.

- If visual scums are present, then a High alert should be declared. This would be applicable for both farm dams and publicly managed water bodies (streams, rivers, etc). Such advice should also be given to farmers who phone the department seeking information on managing blooms in their dams.
- Where blooms dominated by *Microcystis aeruginosa* are present, then the ANZECC/ARMCANZ (2000) guideline of 11,500 cells/mL should be used. Excess of this cell count will constitute a **High alert**.
- Where blooms dominated by *Dolichospermum circinale* are present, then the Orr and Schneider (2006) guideline of 25,000 cells/mL should be used. Excess of this cell count will constitute a **High alert**.
- Blooms of blue-green algae other** than *M. aeruginosa* and *D. circinale* are also common in NSW. These can be of either known potentially toxic species, or of species not considered to be toxin producers. When these blooms are present, a total blue-green algal biovolume in excess of 6 mm<sup>3</sup>/L will constitute a **High alert**. (These are based on Very High alert recommendations for raw water sourced for potable human supply published by WQRA (2010), in lieu of there being nothing else available).
